CHAPTER I
EARNED AND UNEARNED INCOMES, INEQUALITY AND TAXATION

§1
The Conflict of Class Interests

The task confronting us through these chapters is to discover whether taxation can advantageously be used as a chief tool in the attainment and perpetuation of an ideal economic order, and, if so, what system of taxation is best for the end in view. Such an inquiry as is here proposed, may well involve, as a first step, a consideration of the nature of the economic system in and through which the people of the modern world carry on their struggle for the means of existence. For unless we suppose this system to be the best possible, it ought clearly to be either modified in greater or less degree or superseded. And whether the former or the latter change can be most effectively brought about or can be brought about at all by taxation, as well as whether either sort of change ought to be brought about by any method, can hardly be intelligently decided without an
understanding of the fundamental nature of the system of which the modification or supersession is contemplated.

It is the failure clearly to comprehend the nature of the faults of the existing economic system which has, in large part, made protest and even revolt ordinarily so futile in really improving the conditions of life for the common man to the extent that might else be possible. Protestant or revolutionary groups have to meet, always, the more or less solid opposition of the groups whose interests seem to be threatened by change. For few members of the conservative, property-owning class seem able to contemplate without a sense of shock or a feeling of indignation any proposal seriously to disturb in its fundamentals that order or system of things (the existing system of private property) in the meshes of which they have been bred and to which they seem mainly to owe their material well-being. To the support of that system in general, they will usually rally. We need not suppose that they understand it in the sense of being able to contemplate philosophically its faults and its virtues. But they are not completely devoid of an understanding of how it works to maintain them and of how to make the most, in argument, of certain of its apparent advantages. Professional economists in plenty
are at hand to support them and to make plausible by manifold arguments of ingenious intricacy the claim that the present scheme of things is good for the masses and that, anyway, the views of those who attack it are associated with this or that "now generally discredited" doctrine and so "fall to the ground" and "need not be further considered".

Young economists not infrequently get the impression from their teachers that certain liberal or radical views are commonly rejected by reputable members of the craft, and deem it not worth while to investigate them. Subconsciously they come to feel that these views would be likely to put them "outside the pale." For it is not alone through inducing the fear of loss of teaching positions that the defenders of the existing régime control the teaching of economic principles and problems. Public advocacy of views disliked by a dominant financial group or by the general public or by a particularly vocal part of the public may sometimes cost the teacher advocate his job. And yet it is probably true that in a great majority of American institutions of higher learning, the teacher can, if he really wants to, at least bring before his classes for extensive consideration, often with his open approval and almost always when no formal advocacy is expressed, any views and arguments
that he thinks they ought to understand. The teacher, particularly if highly trained and competent, cannot easily be prevented by the ignorant and prejudiced from seeing to it that any facts and any reasoning which he believes are important get before his pupils. When his entire course, including all the textbook assignments, supports only conservative views, this is almost certainly because he desires his pupils to hear, and to sympathize with, only such views. And his own conservatism may be induced, in part, by a subconscious embarrassment at the thought of being suspected of professionally uncommon opinions.

A task more difficult than that of the defenders of the present system confronts those iconoclastic dissentients who must, to be successful, get another system put in its place. These dissentients have to rally the elements of discontent, of which, presumably, they are a part, to the support of a more or less definite program. But these elements of discontent are in large part composed of the relatively untrained masses; hence they are even less likely than the sufficiently ignorant propertied classes to understand the inner nature of those arrangements which most of the propertied classes defend and which it appears to be the interest of the masses to attack; and they can not be expected to have
a very intelligent comprehension of the kinds of change needed or of the type of system which may best be substituted for the one we have. The protesting masses are likely to be attracted by something which sounds radical, which appears to uproot the whole present scheme of things but which, in fact, can not be made to work successfully in the existing state of human nature. They are too likely to be the prey of the demagogue or the fanatic. With a sense of having been unjustly ground down by an economic system which has made others prosperous, they are likely to favor absolute equality of incomes, regardless of differences in efficiency, or to follow a Marxian philosophy and wish to terminate all incomes from property just because these are not labor incomes. If the propertiless masses succeed in acquiring temporary control through revolution, they are not unlikely to blunder from one radical step to another without adequate regard to those elements of human nature which make some things workable and others not, until the general turmoil and poverty and disorganization discredit them far enough to put their deposed masters back into the economic saddle. Even if they act more wisely than would the conservative propertied classes, they are perpetually in danger of counter
revolution, which may restore the pre-existing system.

Again, oftentimes a group of the propertied classes is enabled to use the ignorance and discontent of the propertyless as a means of further lining their own pockets even at the expense, partially, of the rest of the propertied classes, as well as at the expense of the masses. Thus, the tariff protected interests of a country, through their organizations and organs, make it appear to perhaps millions of workingmen that free traders are aristocratic enemies who would take the bread from their mouths to benefit foreigners and that a high tariff system is a necessary means of providing workingmen with jobs.

It is not only the propertyless masses who can be thus put into a false position. Class prejudice sometimes makes groups of the propertied classes whose interests, in a specific reform, are the same as the interests of the masses, nevertheless oppose such a reform. And so, in the case of a protest against various abuses in the system of property, which, if effective, would limit mainly the incomes of the wealthy few, these few are able to lure to their support thousands of small property owners who might even stand to gain by the proposed change, but whose prejudices are those of the larger owners of property and
who are easily roused to a belligerent spirit by anything which can be made to appear to them as a threat against a system of things which they have learned to regard as sacred.

A just and an ideal economic order is, therefore, to the aspiring masses, as is the mirage to the worn traveller in the desert—a hope, whose realization appears perpetually to recede. Such an order or system must, apparently, in the circumstances of class interest and class prejudice, wait upon some development of intelligent understanding of the economic system we now have and of the economic forces at work in that system, on the part of those who are its victims. For, so long as the victims of the existing economic system do not understand the faults of the system against which they protest, well enough, specifically enough, and discriminatingly enough to make workable reforms, so long as they are intellectually incapable of doing aught but lumping together for elimination unlike types of incomes, and so long as their revolts are likely to be guided by a short-sighted selfishness, worth-while reform is hardly to be expected or hoped for. Aristocratic economic relations must probably continue, even if they coexist incongruously with democratic political institutions. Indeed, the exploited masses are ordinarily in large part the dupes of the privileged
interests as well as of their own ignorance, and support, through their own prejudices and their own votes, those very economic policies by which they are laid under tribute.

§2

The Price System and the Specialization of Producers

We have now to analyze the existing economic system so as to see by what processes it works and to what effect. This system is sometimes called the *price* system (a term which would doubtless continue to fit even if considerable changes were made in economic arrangements) presumably because within its sway almost everything is the subject of purchase and sale at a price. Not only food, clothing, furniture, etc., and buildings and lands, but labor services, the use of land, the use for fixed or indeterminate periods of sums of capital, are commonly bought and sold. Prices are the inducements by which men are persuaded to dispose of goods, to lend, and to produce goods for disposal. Money is an intermediary in the exchange of any kind of goods for any other kind. We produce and sell one or some things in order that we may buy other things.

1For a fuller discussion see my *Economic Science and the Common Welfare*, fifth edition, Columbia, Mo. (Lucas Brothers), 1931, especially Chapter I of Part I and Chapters I and II of Part II.
INCOMES, INEQUALITY AND TAXATION

The price system, whether as we know it or as some variant of its present form, is a system which leaves those within it largely free to engage in such occupations and produce such goods as they choose. "They may, indeed, be often subject to the compulsion of circumstances but they are not subject to any other compulsion. Coercive systems of industry are not unknown to historians and to dreamers of Utopias. Slavery was, and is, coercive. Feudalism, with its accompanying serfdom, was coercive to the serf. The caste system of India is coercive. And any variety of socialism which, in the desire of its apostles to avoid the alleged evils of competition, should place men in their jobs, would be coercive. Social reformers must, in fact, make their choice between some form of voluntary selection of occupations, which inevitably means competition for the apparently preferable places, or coercion. There is no other possibility."

It is not difficult to see that a voluntary system must be in some degree a competitive system. If, in a system which allows choice of occupations, one line of industry pays better, all things considered, than another line, those persons engaged in the second line are at liberty to enter the first. But to enter it and sell their product they have to bid down its price, i.e., compete. They then become buyers of what they previously
produced and to get this they may have to bid up its price. Even a socialistic government which should direct all industry must either coerce its subjects into their respective lines of work or must so apportion the rewards in different lines of production as to make voluntary choice yield the desired proportions of various kinds of goods. In other words, the relative amounts of potential competitive offering of services in different lines of production, must be taken account of. Otherwise the system would break down.

Whether such a scientific apportioning of rewards as would be necessary for the successful working of the scheme of individual choice of occupations, would in fact probably be adopted by a democratically governed socialist state, or whether groups of the citizens of such a state would inevitably drift into bargaining and log-rolling, directly or through their representatives, for unfairly large returns at each others’ expense, or whether socialists could avoid a compulsory centralized direction of industry, we need not inquire. Our present interest lies primarily in understanding the nature of the existing system. In this system men engage in producing those goods which they severally think it pays them best to produce, in order to exchange them, through the intermediation of money or bank
INCOMES, INEQUALITY AND TAXATION

checks, for goods which others produce; and if what men get for their production seems too little and what they pay for the goods of their desire seems too much, they have the option of becoming producers of the latter goods of which they have been purchasers, thus tending, by their *competition*, to rearrange the relative prices of these various goods.

The fact that voluntary choice of industry tends thus towards rearrangement of relative prices has led to the statement that competition so affects prices of goods as to make the returns to the persons in any one industry substantially equal to the returns to the persons in any other industry. Such an assertion is true only in an extremely general and indefinite sense. To illustrate the necessary qualifications, let us suppose that A is producing wheat as the best way of getting a living. He might instead produce beets and would do so if that would pay him better. But in view of his individual likes and abilities and the qualities and situation of his land, he can make, perhaps, very much *more* at the business of wheat raising than he could at raising beets. He may even, if efficient enough, be able to make more money raising wheat than anybody else can make producing beets. Nevertheless there are probably some persons whose abilities or the characteristics
of whose land, or both, are such as, at the existing ratio of the price of wheat to the price of beets, would make it more profitable for them to produce beets, and still others who would find it about equally profitable to produce either. These last would shift easily from wheat production to the production of beets or vice versa, according as the second or the first kind of produce rose in price in relation to the other. Those engaged in wheat production will not necessarily receive returns exactly equal to those received in beet production. They may receive either more or less according to the circumstances. Thus, if wheat is much more desired than beets by the community in general, the price of wheat will be high enough to bring into wheat production thousands of persons (and their land or the land they hire) who at a lower price of wheat would have chosen to produce beets. Yet there will still be some who, because of their special aptitudes and their preferences as to kinds of labor or because of the qualities of their land, will continue to produce beets. Their returns will be less than before. The returns of wheat raisers will be greater. But the new condition, like the old, will be one of equilibrium.

Similarly, an increased use of shoes and a diminished desire for hats would, at least for a time, increase the remuneration of shoemakers
and decrease that of hat makers. If the only barrier to change of occupation is the difficulty of learning a new trade, wages in the trade for which there is now a greater demand need not indefinitely remain much higher than in the other trade in order to keep more workers in the former. But if the new work is permanently distasteful to many of those drawn into it in order to satisfy the demand, then the wages paid in it may have to be permanently higher, even if the work involved is to a large number of those engaged in it, the most agreeable work they can find. The persons who would have been in this work, even at the old relation of prices, are therefore fortunate. They enjoy surplus wages or profits above what would have been necessary to induce them to go into the work. They may, and probably will, enjoy larger average incomes than the persons who remain in the other line. And yet there is a sense in which it can be said that incomes in their line are not higher than in the other, viz., that there are still, in the other line, persons who find it, all things considered, preferable.

Such inequality—if inequality it should be called—as results from the conditions above discussed, is *an inevitable concomitant of voluntary choice of industries*. To make incomes equal, under such circumstances, or to reduce the in-
comes of those in the favored line to what we might consider the average level in the other line, it would be necessary to make occupations coercive. Whether or not we can put greater burdens on those who get the larger incomes than on those who, in either line, receive smaller incomes, is a different matter, which we need not now discuss. It suffices, for the present, to point out that public policy can not advantageously be discriminatory as between industries, unless the industry discriminated against is an undesirable one, e.g., the manufacture and sale of harmful drugs, or unless it is, or partakes somewhat of the nature of, monopoly.

There are, however, cases of difference between occupational incomes which ought, in the opinion of many, to be in some way corrected. These are cases from which the element of monopoly seems not to be wholly absent. Thus, there may be many persons in a given line of production, not because the pay is good and not because the work is pleasant but solely because those who are in this line are disqualified by lack of ability or lack of training for engaging in other lines where competition is less intense. The prices of the material goods or the services they turn out will be relatively low because these goods or services are relatively plentiful, yet the labor involved may be difficult and unpleas-
ant. So far as the explanation for the small per capita remuneration received, is to be found in the lack, by many or most of the people concerned, of the innate ability necessary for the performance of other, better rewarded tasks, the difficulty lies in there being a relative surplus of people who lack relatively desirable (in view of contemporary human needs and tastes) physical or mental characteristics. The biologist interested in eugenics would be likely to fear that partly to support such a class from the surplus earnings of citizens whose characteristics were better adapted to the satisfaction of the more important or of relatively inadequately satisfied human wants, might involve counter selection, an undue multiplication of the unfit. There may be, indeed, too much counter selection as it is. If so, that is an added reason for not adopting a social policy calculated to increase it.

But human beings are probably not, innately, so different in ability that most of the present inequality can be thus accounted for. There are certainly very many persons whose natural aptitudes would enable them to undertake better paying work than they are at present engaged in, if only they had the requisite training. Sometimes early disinclination to study and sometimes the cost of education have been the obstacles that have kept them from rising out of the
ranks of common labor. If, indeed, learning can be secured only by the children whose parents have large incomes and if large labor incomes can be secured only by those who are able to get considerable training, we have a vicious circle of cause and effect. Perhaps this is one of the reasons—though the need for intelligent citizenship and leadership in a democracy is surely another—why it is generally assumed in progressive democratic countries that a system of public education should keep educational opportunity at least within the possible reach of nearly all.

Nevertheless, there are probably limits to the burden which the public ought to be required to assume, even for the spread of education. For one, and a most important, explanation of unequal wages is unequal birth rates. If wage receivers who are unable to earn much because those in their lines are too many, and because the goods or services produced in these lines are therefore too plentiful, were to limit their families, each, to the number they could comfortably support, their excess of numbers, even if few among them worked up into a "higher" economic class, would, in a few generations, cease to be a cause of low remuneration. Higher wages in such a group would result from smaller numbers in it. And higher wages, together with smaller families, would enable the members of the group
individually and even without public assistance, to give their children better training. If the masses of people will not practice birth limitation, while certain groups do practice it in order that their fewer children may be better reared and trained, then there is grave doubt whether the latter class ought to be heavily taxed in order that the children of the former may have equal opportunities. Continuous increase of population, since natural resources are limited, tends towards diminished per capita production. Hence a policy of providing for the training of the children of those who multiply rapidly, by drafting the surplus incomes of those who do not, though it may indeed equalize incomes, is almost certain to equalize them downward; while the spread of birth limitation among the classes which suffer—while others gain—from their surplus of numbers, tends to equalize upward.

But the poor, as well as the rich, love their children and wish to provide for them as comfortable an existence and as favorable opportunities as possible. They do not ordinarily desire to have more children than they can reasonably well support. Were it not, therefore, that knowledge on the subject of limitation of births is made comparatively inaccessible to the masses, through legal barriers, our ideals of family
life and of opportunity for children would be more widely realized.

§3

_Earned and Unearned Incomes—Wages and Managerial Profits_

In the previous section the endeavor was made to explain only the inequality which may result between different occupations or lines of production, in the price system. So far as we discussed wages, our interest lay in the relation of the wages of unskilled to the wages of skilled labor. We did not attempt to show how the interests of different economic classes, e.g., laborers and capitalists, in any one line of production are related to each other. The persons connected with the production of each kind of wealth or service are divided into classes or sub-groups having interests more or less diverse. We shall consider these sub-groups as three. There are those who perform the labor, those who provide the capital and those who own the land, used in carrying on the production. The corresponding incomes are wages, interest, and land rent.

The wages of labor are received for labor services. They depend on demand for and supply of labor and, ultimately, on the (marginal) productivity of the labor. If the services of a
workman add more to the productivity of an industry than he receives in wages, it becomes profitable to employ him, and demand for his services is likely to result in increasing these wages. (Though custom, prejudice, immobility of labor, and lack of means for exact measurement of the amount and value of work done, may make the readjustment slow and rough.) If, on the other hand, a man's services appear to be of less value than his wages, then these services are not likely to be in demand unless and until the wages fall. Taking the case of a group of wage earners of equal ability, we may reasonably suppose that any establishment which could use their services would tend to employ more of them at a lower wage than at a higher wage, for it would tend to employ them up to such a point that the gain from hiring more was zero. And wages tend to be low enough so that substantially all the labor force of a community (emigration aside) can get employment among all the manufacturing, mining, farming and other establishments. Without our insisting, however, on all the technical points of economic theory, it should be clear that wages are paid for services rendered, that their amount is fixed by demand and supply, and that demand and supply so operate as to make wages higher when labor productivity is large than when it is small. We have already
seen why wages may be higher in one line than in another in connection with our study of the relation of the prices of some goods to the prices of other goods. It should be clear, also, that the more efficient workers in any given line will be able, on the average, to command higher wages than those who are less efficient.

Among incomes from labor ought to be included those returns to the owners and managers of industry, above interest on their capital and rent on their land, which economists sometimes call managerial profits. These are the rewards of self-directed labor, as contrasted with wages the amount of which is more or less contracted for in advance. Hence they are even more sensitive to the efficiency of the worker at his job than are ordinary wages. But they are certainly none the less the rewards of effort and are not to be confused with the incomes which employers get by virtue of their ownership of property.

- Incomes from labor are often assumed to have some special justification as distinguished from incomes from property. Socialists, for example, assert that labor alone produces value and argue for the termination of all incomes from property. And while it may be doubted whether this sect, if in control of our economic life, would be very tender with those incomes from labor which we
call profits, they would, if consistent, necessarily be more tender with those incomes than with interest or rent.

Whatever may be true of most labor incomes, it is certain that some incomes from labor are unearned, if the test be the giving of a *quid pro quo* to those from whom, in the last analysis, the incomes in question are drawn. When, for example, a group of men successfully form a monopoly in order to raise the price of their goods or services, to the public, above a normal competitive return, the reasonable presumption is that this excess above a competitive return is unearned. So, also, when, though monopoly is not formally or completely established, methods of business are adopted which are calculated to eliminate even an exceptionally efficient producer, the additional incomes received by those adopting these methods are to be regarded as unearned. So-called unfair competition is in this category. Thus, a business concern may, as the National Cash Register Company was proved in court to have done, misrepresent a competitor's goods; it may, if it controls the major part of the business in its line, so that most dealers will feel obliged to handle its goods, eliminate smaller

---

*Various methods of unfair competition which were practiced by this company are described in Seager, *The Principles of Economics*, New York (Holt), 1913, pp. 93-499.
even though more efficient producers by ordering dealers not to sell the latters' goods on penalty of not being allowed to handle *its* goods; or such a concern may make arrangements with transportation companies to discriminate in its favor and against its rivals, in the matter of freight rates, thus again, despite the possible superior merit or greater cheapness of the latters' goods, eliminating them from the market. Income secured as a result of such (now, in the United States, outlawed) methods of competition, clearly is not to be regarded as earned.

But the case is different with the owners and managers of a concern which increases its business and displaces many of its rivals by virtue of the superior quality or cheapness of its goods, a superiority resulting from more intelligent selection or use of machinery, better adaptation of tasks to men, better organization of work, or other waste-saving proficiency. Business and income so secured are an index of superior service to the public and are not, as in the cases previously discussed, a badge of dishonor.

The incomes of employees, like the labor incomes of managing employers, may also be either earned or unearned, according as those from whom they are ultimately derived—usually the consuming public—do or do not receive an equivalent in goods or services.
§4

Earned and Unearned Incomes—Interest

Incomes from property may be either from capital or from land. We shall consider, first, those from capital. As with incomes from labor, they may be either earned or unearned. This assertion, of course, runs counter to the socialistic view that interest as such is always exploitation. "According to the doctrine of orthodox socialism, labor produces all value. From this premise it is argued that those who perform the labor should get the entire product. Since they do not get the entire product of industry, the present economic system is asserted to be one of robbery. Of course, as a matter of sound logic, it is impossible thus to distinguish between labor and capital. While it may be true that nothing or next to nothing can be produced by capital without labor, it is likewise true that next to nothing can be produced by labor without capital. Labor without buildings, roads, machinery and tools would, indeed, be helpless and might easily perish.

"So much the socialist would perforce admit, but he would perhaps reply that, although labor

3In Economic Science and the Common Welfare, Part II, Chs. II and IV, I have attempted a more exhaustive study of interest on capital than is here presented.
must use capital, capital is but the child of labor, that capital is only an intermediate step between the putting forth of labor and the securing of the full product of labor. This reply, however, hardly gives a full account of the matter. Capital is always a surplus above the needs of present consumption. Hence its creation involves not only labor but also a refraining from the present consumption of the products of labor. In short, the creation of capital involves abstinence, or waiting, or saving. The person who, though he labors most efficiently, consumes in current gratification all that his labor produces (or an equivalent in other goods for which the goods he has produced are exchanged), adds nothing to the capital equipment of society. The only persons to whom society owes anything for the benefits yielded by capital are those persons through whose saving, as well as their labor, the capital comes into existence. And if an increment of capital adds anything to the annual output of the community’s labor force, beyond what this labor force would produce with that much less capital equipment, such an added annual output of industry is certainly made possible by that person or those persons whose saving, whose excess of production over consumption, brought the capital into existence. And, further, provided the person whose production and saving
make possible the existence of the capital, gets, as interest on this capital, no more than the use of the capital adds to the production of goods and services which would have been possible without it, *he cannot be said to rob anyone*, since no one is any worse off than if the accumulator of the capital had never brought it into existence. If the socialist would say, frankly, that, though the accumulator of capital makes possible an addition to the annual product of industry above what all the labor available and all previously existing capital would otherwise produce, and is in that sense the real producer of this additional annual output, nevertheless not he but the other members of society ought to get this additional product, ought to exploit the actual producer of it, we might disagree with the socialist but we could at least understand him. But to say that labor *produces all wealth* is economic nonsense. And in saying this, in the sense in which he does say it, and basing upon it serious conclusions regarding public policy, the self-styled scientific socialist reveals his system as a pseudo-science. In this regard, nearly all types of socialism seem to be on common ground. Interest appears to be anathema to socialists of all or nearly all schools, not merely to those of professed Marxian leanings.”
Lest the reader still does not clearly realize that saving is as essential to capital construction as is labor, it will be advantageous to trace out in greater detail the interrelations of savers (who may or may not be laborers) and the laborers employed by the savings. Wheat raisers (assuming them to do the saving) produce wheat in excess of their own needs; they sell this excess on the market and it becomes a part of the stock of usable wealth of the community. The money they receive may be regarded as so many *tickets* entitling them to draw from this stock a value equal to what they have put in. But they do not spend all of this money in withdrawing consumption goods. A part of the money is saved. The saved money is invested in the stock or bonds of an agricultural machinery company (either directly or through the intermediation of a savings bank, or other financial institution). The company then uses this money to hire labor to build its factory. The laborers employed to build, in spending their money for bread and other necessary or desired goods, are taking from society's stock and using up, the goods which the saved money represented. While doing this, however, they have produced a factory. Therefore the persons who did the saving and investing now have ownership in the factory instead of having had and enjoyed the
other wealth which they might by now have consumed, had they chosen the alternative of not saving. But it is through their saving that the factory has been made possible. Those who built the factory have been "staked" by the savers. Otherwise the former must have spent their time producing goods for immediate consumption. In short, some persons are able to spend their whole time producing capital (which they can neither eat nor wear) because others produce an excess of food, clothing and other consumption goods beyond their own needs.

"Nor can the socialist easily distinguish between wages and interest on other grounds, so as to justify one and condemn the other. He cannot, for instance, make an ethical distinction by asserting that wages are a reward for sacrifice and interest a payment not earned by sacrifice. To be sure, saving may be, for many, a pleasure which they would indulge were no interest paid. Particularly may persons whose incomes are large, save considerable amounts for the benefit of their children without being conscious of appreciable present deprivation. But the labor for which wages are paid may also be, in some cases, not only not a sacrifice, but a continuous source of pleasure. There seems to be a notion, among socialists and some others, that the reason why wages are paid and, also, the reason why
wages should be paid, is because labor is unpleas-
ant. It is true that the greater unpleasantness of one kind of work than of another, when the latter does not require a more rare type of ability than the former, gives rise to higher pay for the former. But if all work were a delight—as some work is to some workers—those who did the work would not on that account consent to forego their pay. Nor would any employing property owner be able to avoid paying wages for work done, so long as labor was productive, since he would have to reckon with the com-
petition of other employers to whom productive labor would seem worth hiring. It is because labor produces something that wages are paid and not because labor is unpleasant. Similarly, it is because capital and, therefore, in effect, saving, produces with labor more than labor alone could produce, that interest is paid for the use of capital in industry.” The time has gone by when sacrifice as such can be regarded as a virtue apart from any beneficial consequences it may produce, or can be regarded as entitled, in itself, to any reward.

It does not follow that all interest is earned any more than that all wages are earned. Capital, as well as labor, may be so used as to produce a dis-service rather than a service to the general pub-
lic. Capital may be invested in the means of
INCOMES, INEQUALITY AND TAXATION 37

corruption, in building up political influence through which the public is exploited, in the tools and machinery of noxious drug making, in the plant of a periodical devoted to misrepresentation. If so, the interest received cannot be said to be earned in the sense in which we are using the term. So far as interest on capital and remuneration of labor are received by persons who do not give for them equivalent service to those from whom such interest or wages are in the last analysis drawn, it would seem that the receipt of such interest and wages by them should be prevented, if prevention is in any way possible. A democracy can hardly afford to have a privileged class deriving large incomes for disservices or even for negative services.

Under the plan of things laid down by orthodox socialists no individual, as such, would be allowed to own capital to any appreciable extent. Certainly no one would be allowed to own any of the machinery of production. Hence, no individual could have any motive in accumulating capital unless that motive were the common good and he would not actually accumulate it unless the influence of such a motive outweighed the personal and family sacrifice involved. Capital would, therefore, under such a régime, presumably have to be accumulated and maintained by the state. This would mean,
in a democratic community, that saving would have to be supported, or at least tacitly agreed to, by a majority of citizens, in order that any saving should be done, while under the present system capital is accumulated even if only one person out of ten or one out of a thousand is willing to make the incident present sacrifice.

Again, such state saving as the orthodox socialist would resort to is, for the individual who is not in the majority, compulsory saving. He must accept, in present consumable goods, only that part of the wages he would otherwise get, which the majority permits, in order that the remainder should be used for the maintenance or the increase of capital. Or, on the other hand, in case the majority decides against adequate saving, then the individual who would have saved must see the community’s productive equipment depreciate and the prospect of a good living for his children progressively decline, without being able to apply any remedy.

§5

_Earned and Unearned Incomes—Land Rent_ ¹

In beginning a consideration of land rent we may advantageously call attention to a fundamental distinction, too often overlooked, be-

¹This topic is discussed more fully in later chapters and especially in Chapter III.
between rent and interest. It is sometimes said that the rent of land is no less interest than the return on other capital, since the return on land can be viewed as a given percentage on a given valuation, while, on the other hand, the interest on other capital can be viewed as an absolute amount in dollars per machine or factory, just as land is viewed as so many dollars per building lot or per acre a year. But more fundamentally there is a difference, despite the superficial resemblance, between situation rent and capital interest. The return on land should be looked at as an absolute amount measured and determined by the surplus above interest and wages (the surplus over production on the extensive or intensive margin), which can be produced by industry on the land in question. It is not determined by the value of the land. Neither has the value of land as such, i.e., *its situation value apart from improvements*, any relation to any cost of production, since the land was not humanly produced. On the contrary, the value of the land can be arrived at only by capitalizing its expected future rents or returns at some previously found rate of interest. Thus, a piece of land which would yield $5,000 per year net rent (above taxes, wages of labor employed, interest on the capital invested in buildings and other improvements, and depreciation) would be worth, if in-
terest were 5 per cent, $100,000. Were the current rate 10 per cent, such a piece of land would be worth but $50,000.

With equipment of the producible and reproducible kind, however, the relation between capital and income value is not the simple one above outlined. The value of such capital, though not unaffected by the value of its expected services, is very directly related to the cost of its production. Buildings of a type costing $5,000 each will hardly be put up to sell for much less, as a rule, by the builders. Nor, so long as the alternative is open to him of supervising the construction of a similar building, will a possible buyer care to pay a great deal more. The value of a building is determined then, in large part, by the expenses, such as wages, of producing the materials and of putting it up; and these wages are determined, in the last analysis, by the existence of alternative lines of activity open to the wage-earners, while the other costs are determined by the alternative uses to which the land or capital which must be used in producing the materials might be put.

Since the value of produced and reproducible capital is thus in large part fixed directly by its cost of production, the assertion that interest is in large part determined by the rate of productivity of capital does not involve reasoning in a circle. Interest is 5 per cent because, for one
and perhaps the most important reason, capital worth $10,000 will produce an annual net income of $500. It therefore appears, to sum up our conclusions thus far, that the value of produced capital depends in a considerable degree on cost of production, that the ratio between the value of capital and its income is an important factor in determining the general long-run rate of interest, and that this rate of interest is an essential element in the valuation of land.

It appears to be but a short step to the conclusion that the accumulators of produced capital may—and in many cases doubtless do—add to the value of the annual aggregate income of society as much as they take out of this income in interest; while the owners of land, as such, contribute no service in return for their income. Whereas, in the case of produced capital, the public (except in certain cases, numerous enough no doubt, where the capital is wastefully or injuriously used) pays the owner for a service which, without his saving (or the saving of someone whose right to payment has been transferred to him) would not have been enjoyed; in the case of land the payment is made for a benefit which is dependent on no individual's saving or effort and a benefit for which, therefore, no individual is responsible. In the one case the community pays for a service which is actually rendered
to it. In the other case it pays people who have, in the capacity in which they are paid, rendered no service.\textsuperscript{5}

To avoid any possible misunderstanding, let it be emphasized that land rent as here defined does not mean merely the sum paid by a tenant to an owner, for the use of the land, but equally the amount received by the person who himself uses his own land, in excess of wages for his labor and interest on his capital. This rent comes to him in money when he sells the goods or services which the land produces. He is paid, thus, by others, for benefits which not he but the land renders. The community, in buying from him, pays him for more than the service he and his capital render them.

The nature of land rent and of the influences that bring it into existence can not, perhaps, be better set forth than in the following classic passage from Henry George's \textit{Progress and Poverty}:\textsuperscript{6}

"Here, let us imagine, is an unbounded savannah stretching off in unbroken sameness of grass and flower, tree and rill, till the traveler tires of

\textsuperscript{5}Professor Edwin R. A. Seligman, whose views regarding the ideal sort of taxation appear to be fundamentally antagonistic to those presented in this book, has, in the opinion of the present writer, signally failed to grasp the distinction set forth above. See his \textit{Principles of Economics}, sixth edition, New York (Longmans), 1914, paragraph beginning at bottom of page 391.

\textsuperscript{6}Book IV, Chapter II.
the monotony. Along comes the wagon of the first immigrant. Where to settle he cannot tell—every acre seems as good as every other acre. As to wood, as to water, as to fertility, as to situation, there is absolutely no choice, and he is perplexed by the embarrassment of richness. Tired out with the search for one place that is better than another, he stops—somewhere, anywhere—and starts to make himself a home. The soil is virgin and rich, game is abundant, the streams flash with the finest trout. Nature is at her very best. He has what, were he in a populous district, would make him rich; but he is very poor. To say nothing of the mental craving, which would lead him to welcome the sorriest stranger, he labors under all the material disadvantages of solitude. He can get no temporary assistance for any work that requires a greater union of strength than that afforded by his own family, or by such help as he can permanently keep. Though he has cattle, he cannot often have fresh meat, for to get a beefsteak he must kill a bullock. He must be his own blacksmith, wagonmaker, carpenter, and cobbler—in short, a ‘jack of all trades and master of none.’ He cannot have his children schooled, for, to do so, he must pay and maintain a teacher. Such things as he cannot produce himself, he must buy in quantities and keep on hand, or else go without, for he
cannot be constantly leaving his work and making a long journey to the verge of civilization; and when forced to do so, the getting of a vial of medicine or the replacement of a broken auger may cost him the labor of himself and horses for days. Under such circumstances, though nature is prolific, the man is poor. It is an easy matter for him to get enough to eat; but beyond this, his labor will suffice to satisfy only the simplest wants in the rudest way.

"Soon there comes another immigrant. Although every quarter section of the boundless plain is as good as every other quarter section, he is not beset by any embarrassment as to where to settle. Though the land is the same, there is one place that is clearly better for him than any other place and that is where there is already a settler and he may have a neighbor. He settles by the side of the first comer, whose condition is at once greatly improved, and to whom many things are now possible that were before impossible, for two men may help each other to do things that one man could never do.

"Another immigrant comes, and, guided by the same attraction, settles where there are already two. Another, and another, until around our first comer there are a score of neighbors. Labor has now an effectiveness which, in the solitary state, it could not approach. If heavy
work is to be done, the settlers have a log-rolling, and together accomplish in a day what singly would require years. When one kills a bullock, the others take part of it, returning when they kill, and thus they have fresh meat all the time. Together they hire a schoolmaster and the children of each are taught for a fractional part of what similar teaching would have cost the first settler. It becomes a comparatively easy matter to send to the nearest town, for someone is always going. But there is less need for such journeys. A blacksmith and a wheelwright soon set up shops and our settler can have his tools repaired for a small part of the labor it formerly cost him. A store is opened and he can get what he wants as he wants it; a postoffice soon added, gives him regular communication with the rest of the world. Then come a cobbler, a carpenter, a harness-maker, a doctor; and a little church soon arises. Satisfactions become possible that in the solitary state were impossible. There are gratifications for the social and the intellectual nature—for that part of the man that rises above the animal. The power of sympathy, the sense of companionship, the emulation of comparison and contrast, open a wider, and fuller, and more varied life. In rejoicing, there are others to rejoice; in sorrow, the mourners do not mourn alone. There are husking bees, and apple parings,
and quilting parties. Though the ballroom be unplastered and the orchestra but a fiddle, the notes of the magician are yet in the strain, and Cupid dances with the dancers. At the wedding, there are others to admire and enjoy; in the house of death, there are watchers; by the open grave, stands human sympathy to sustain the mourners. Occasionally, comes a straggling lecturer to open up glimpses of the world of science, of literature, or of art; in election times come stump speakers, and the citizen rises to a sense of dignity and power, as the cause of empires is tried before him in the struggle of John Doe and Richard Roe for his support and vote. And, by and by, comes the circus, talked of months before, and opening to children whose horizon has been the prairie, all the realms of the imagination—princes and princesses of fairy tale, mail-clad crusaders and turbaned Moors, Cinderella's fairy coach, and the giants of nursery lore; lions such as crouched before Daniel, or in circling Roman amphitheater tore the saints of God; ostriches who recall the sandy deserts; camels such as stood around when the wicked brethren raised Joseph from the well and sold him into bondage; elephants such as crossed the Alps with Hannibal, or felt the sword of the Maccabees; and glorious music that thrills
and builds in the chambers of the mind as rose the sunny dome of Kubla Khan.

"Go to our settler now, and say to him: 'You have so many fruit trees, which you planted; so much fencing, such a well, a barn, a house—in short, you have by your labor added so much value to this farm. Your land itself is not quite so good. You have been cropping it, and by and by it will need manure. I will give you the full value of all your improvements if you will give it to me and go again with your family beyond the verge of settlement.' He would laugh at you. His land yields no more wheat or potatoes than before, but it does yield far more of all the necessaries and comforts of life. His labor upon it will bring no heavier crops, and, we will suppose, no more valuable crops, but it will bring far more of all the other things for which men work. The presence of other settlers—the increase of population—has added to the productiveness, in these things, of labor bestowed upon it, and this added productiveness gives it a superiority over land of equal natural quality where there are as yet no settlers. If no land remains to be taken up, except such as is as far removed from population as was our settler's land when he first went upon it, the value or rent of this land will be measured by the whole of this added capability. If, however, as we have supposed,
there is a continuous stretch of equal land, over which population is now spreading, it will not be necessary for the new settler to go into the wilderness, as did the first. He will settle just beyond the other settlers, and will get the advantage of proximity to them. The value or rent of our settler's land will thus depend on the advantage which it has, from being at the center of population, over that on the verge. . . .

"Population still keeps on increasing, giving greater and greater utility to the land, and more and more wealth to its owner. The town has grown into a city—a St. Louis, a Chicago, or a San Francisco—and still it grows. Production is here carried on upon a great scale, with the best of machinery and the most favorable facilities; the division of labor becomes extremely minute, wonderfully multiplying efficiency; exchanges are of such volume and rapidity that they are made with the minimum of friction and loss. Here is the heart, the brain, of the vast social organism that has grown up from the germ of the first settlement; here has developed one of the great ganglions of the human world. Hither run all roads, hither set all currents, through all the vast regions round about. Here, if you have anything to sell, is the market; here, if you have anything to buy, is the largest and the choicest stock. Here intellectual activity
INCOMES, INEQUALITY AND TAXATION

is gathered into a focus and here springs that stimulus which is born of the collision of mind with mind. Here are the great libraries, the storehouses and granaries of knowledge, the learned professors, the famous specialists. Here are museums and art galleries, collections of philosophical apparatus, and all things rare, and valuable, and best of their kind. Here come great actors, and orators, and singers, from all over the world. Here, in short, is a center of human life, in all its varied manifestations.

"So enormous are the advantages which this land now offers for the application of labor that instead of one man with a span of horses scratching over acres, you may count in places thousands of workers to the acre, working tier on tier, on floors raised one above the other, five, six, seven and eight stories from the ground, while underneath the surface of the earth engines are throbbing with pulsations that exert the force of thousands of horses.

"All these advantages attach to the land; it is on this land and no other that they can be utilized, for here is the center of population—the focus of exchanges, the market place and workshop of the highest forms of industry. The productive powers which density of population has attached to this land are equivalent to the multiplication of its original fertility by the hundred fold
and the thousand fold. And rent, which measures the difference between this added productivity and that of the least productive land in use, has increased accordingly. Our settler, or whoever has succeeded to his right to the land, is now a millionaire. Like another Rip Van Winkle, he may have lain down and slept; still he is rich—not from anything he has done, but from the increase of population. There are lots from which for every foot of frontage the owner may draw more than an average mechanic can earn; there are lots that will sell for more than would suffice to pave them with gold coin. In the principal streets are towering buildings, of granite, marble, iron and plate glass, finished in the most expensive style, replete with every convenience. Yet they are not worth as much as the land upon which they rest—the same land, in nothing changed, which when our first settler came upon it had no value at all.”

But, it may be said, at least many of the present land owners are persons who have made their savings from what they have earned and have chosen to invest their savings in land rather than elsewhere. Have they not, in their savings, given the community as much value as they draw in rent? The answer of a thorough-going critic of our current land and taxation policy may well be that they have given, to that part
of the community from whom their rent income is derived, nothing whatever. If A, who has saved $10,000, uses it to buy a piece of land from B, he is merely paying B for the privilege, previously enjoyed by B, of receiving rent from others for the use of something that neither he nor any other individual produced and the use of which would be equally available had no owner or purchaser of land ever been born. In turn, B has now the $10,000 of accumulations and it is quite possible that he may use this capital in some way that will increase the annual product of industry. If so, the community, or some members of the community, will come to be paying B, in interest on capital, for services which, without A's saving, would not have been available, while they will be paying A, in rent, for benefits from the use of land, which are not due to any individual's work or saving. If, before, the community was paying the landowner, B, a rent while getting no service that could fairly be regarded as coming from him, now it is making payments to both A and B, as rent and interest respectively, and receiving services in return from only one. If, before, B, the landowner, was a pensioner to whom the community gave something for nothing, now A has become the pensioner, having bought out B, and is receiving, from the rest of the community, some-
thing for nothing. For it should be clearly evident that the $10,000 paid to B for the land is not a service rendered to C, D, or E, who are the persons who have to pay A for the use of the land. Yet much of emphasis is commonly directed to the assertion that the land-using part of the community ought to pay rent to landowners because these landowners have in many cases paid previous landowners for the land and despite the fact that none of the landowners in the series can be said to have rendered any service to those from whom they collect rent payment. In other words, it is asserted that C, D and E ought to be obliged to pay A for no service rendered by him or by anyone, simply because A previously paid $10,000, not to C or D or E, but to B. Is such a doctrine good utilitarianism? Is its application good social policy? These are questions which will be discussed at length in succeeding chapters.

✓ The same principles apply in the case of such natural resources as coal and iron mines, oil and natural gas wells and power sites. The income derived by the owners of such resources appears to represent, not service, but the privilege of drawing tribute from the masses as a condition to allowing these masses to make use of the bounty of nature. And those enthusiasts for government ownership of all natural resources,
who would have the public buy up these resources from their present owners at current values are, in this view, simply proposing that the tribute now collected as rent or royalties or dividends shall be given an added sanction and shall be collected in the future as interest on government bonds, to the payment of which the government will be pledged. These natural resources had no cost of construction. Their salable value seems to be but the capitalization of tribute. To issue government bonds for them is, therefore, it may be said, only to make this tribute rendering more irrevocable than before.

“Certain contemporary economists appear to think that classification of incomes according to sources is of no especial importance. In their view, the extent of inequality, as statistically ascertained, may be a matter of significance, and the fact that one man has an extremely large income while another is bitterly poor may even be distressing. But whether the one income or the other is derived from (say) labor or from the legal right to make others pay the recipient for the use of a part of the surface of the earth and for the enjoyment of community-produced advantages, is a matter with which only an economist unemancipated from classical traditions would concern himself!

“Can we not imagine how an economist with
this view of the irrelevance of the sources of incomes, would approach a consideration of slavery? The fact that the slave-owner’s income was derived from the labor of the slave would not be significant. Instead, it would be necessary to make a statistical study of the relative incomes of different persons in the community, both slaves and slave owners. Such a study might then be pointed to as revealing the fact that no necessary relationship existed between a person’s income and his status as slave or slave-owner. Some slaves—e.g. the more favored domestic slaves of wealthy masters—might be shown to be fairly prosperous. On the other hand some slave-owners—those owning only one or two slaves and little else and not managing these very effectively—would appear to be very poor, poorer than some slaves. Into some such statistical investigation would well-to-do slave-owners—and, probably, even poverty-stricken slave-owners—prefer that any discussion of incomes should be diverted. And when questions are raised with regard to the sources of certain incomes in the present-day civilized world, some ‘modern’ economists can seemingly find no better method of inquiry! But something much more fundamental is necessary if our study of economic society is to point the way to just and wise reform.”
The suggestion has been made (most prominently and effectively by Henry George) that the proper way for the community to deal with the rent of land is to appropriate it to public use by the method of taxation. Whether or not it is possible or desirable to take all or the major part of the rental value of land by taxation—and this question will be discussed more particularly in later chapters—it should be clear that, under the competitive individualistic system of business, no other method of preventing the individual receipt of land rent is possible. If, for example, when the owner and user of a piece of land were different persons, the owner could be forbidden to charge as rent the surplus, due to advantageous situation, yielded by that specific piece of land above the ordinary returns to labor and capital, the user would proceed to appropriate such surplus. For the fact that the titular owner was not allowed to charge rent would not increase the supply of the goods produced or marketed on the land, and, since price is fixed by demand and supply, would not lower the price of such goods. The producer or dealer who was fortunate enough to have, for nothing, the use of a piece of land so good or so advantageously situated as to give him a larger return than would cover his outlays for wages and interest (including interest on his own capital)
and pay for his own time, would not, on that account, sell his output below the market price charged by competitors. But even if he did, his competitors need not lower their price, since there has been no increase in supply or decrease in demand, and since, therefore, the demand on other producers or dealers by consumers who were still unsatisfied, would be as great as before. So, even if the favored producer did lower his price (as it is safe to say he would not), that would merely pass the favor to a privileged few of the consumers of the article. The price could not be reduced to all consumers unless reduced by all other producers.

Furthermore, some of these other producers are operating under conditions such that their labor and capital produce little or no surplus for rent; they may be, for instance, producing on land so poor for the purpose that it yields substantially no surplus.\(^7\) For them to reduce their price would be to curtail their wages or interest or both. In that case, the attempt to terminate rent would result in lessening other kinds of incomes of the producers of the goods in question and giving these incomes to the consumers of the goods. But these consumers can be no other than the producers of other goods.

\(^7\)Or they may be producing on what economists call the intensive margin.
INCOMES, INEQUALITY AND TAXATION 57

The injured producers would, therefore, under a régime of free choice of industry, change their occupations and the line of their investment. In short, rent can not be distributed to all consumers of all goods, and to give it to some consumers or to transfer it to tenants leaves as large an element of special privilege in the situation as before. Unless, then, appropriation or taxation of rent, by and for the whole community, is possible, the situation is irremediable under the competitive system of business.

One thing, at least, can be asserted with positiveness, viz., that a tax on the rental value of all land, however used, can neither be shifted from one landowner to others nor from landowners as a class to any other class. The reasons are that such a tax can in no wise limit the supply of land or determine the direction of its use. It cannot decrease the supply of land because land, as we have defined it, is not humanly produced. If it were, a tax on it might decrease the amount of it and so make rent higher. “If the landowners who lease their land charge higher rents for its use, tenants will endeavor to economize in the use of land and some of the owners will find their land idle and yielding no revenue. These will quickly reduce their rent charges, the more so if unused land is taxed at the same rate as used land, since only so can they avoid loss.
"We may state the matter convincingly in a somewhat different way if we call attention to the fact that the landowners were presumably, before the tax was laid, charging all the rent they could get. There is nothing in the tax to make tenants willing to pay more or land more difficult to hire. Supposing the tax to apply also to unused land, even more land will probably be on the market for hire than would otherwise be the case, because of the loss to owners in leaving their land idle. Hence, owners cannot raise their rents.

"To put the matter in still another way, it may be said that rent is the surplus which can be produced by labor and capital on any piece of land above what that labor and capital could produce on the poorest land in use,\(^8\) for which no rent is paid and which has either no value or a purely speculative value based on prospects. A tax on the value of land would not increase this surplus yield on the superior land, and could not, therefore, increase rent.

"Let us suppose that a tax is levied upon a piece of land because of its value, because, that is, of its superiority over the poorest land in use and in proportion to that superiority, and that

\(^8\)Or, more fully stated in the terminology of economics, above the amount which labor and capital could produce on either the extensive or the intensive margin of production.
the owner of the land tries, because of the tax, to charge more rent to the tenant. In that case the tenant may resort to poorer land on which the rent and, therefore, the tax is insignificant, if not zero, and leave without rent and with his tax nevertheless to be paid, the too grasping landlord. Such a prospect or its actual realization must cause the owners of land to keep down their rent charges and to pay the tax themselves."

Since a tax on land values—or on the annual rental value of land, for this comes to the same thing*—cannot raise rents, it can in no way raise the prices which tenants charge for the goods they produce or sell. But can it raise the prices charged by the owners of the land for the goods they produce or sell when they themselves use their land? Clearly not. Such owners will not, because of the tax, produce any less of the goods in the production of which they are engaged. Refusing to produce the goods would not relieve them of the tax. They will produce as many goods as if there were no tax. And if the tax does not make such goods any scarcer, their prices will not be made higher. In other words,

*Although the capital value is affected by the tax and falls as the tax rises, while the rental value is relatively independent of the tax. It is, therefore, simpler to tax economic rent than to tax capital value. Indeed, a tax on rent of 100 per cent, would reduce capitalized value to zero.
if, before the tax is laid, landowners are charging
for their goods all they can get, the tax will not
cause them to charge any more for they cannot
get any more.

If, then, we look at the matter of general land-
value taxation from any point of view whatever,
we arrive at the same conclusion, viz., that a
tax on the rental value of land is paid by the
owner of the land and by no one else, that the
owner cannot because of such a tax raise either
his rent or the prices of his goods, but that,
indeed, productive land held out of use by specu-
lators is forced onto the market so that, if land
rent changes at all, the direction of the change is
likely to be downward. Other taxes may dis-
courage production. But land-value taxation,
so far as it has any effect at all on production,
operates to increase it and thus to reduce prices
or to raise wages or both.

But before discussing at length the question
whether taxes on the rental value of land should
be greatly increased, we shall consider with
some care—in the next chapter—the contention
currently so frequently heard from landowners,
that such taxes should be decreased, that land
should be "relieved" even of a part of the tax
now levied upon it.
§6

Inheritance, the Family and Inheritance Taxation

"Enthusiasts for inheritance taxation believe it should be made a most important source, even the most important source, of public revenue. Indeed, some call into question the whole system of inheritance, on the ground that through it the individual receives what another, e.g. a father, grandfather, brother or other relative, has earned. The institution of inheritance is said to make for inequality. Most persons begin life with nothing or nearly nothing. A few start with property worth a few thousand dollars. Still fewer find themselves, by no virtue of their own, the heirs to property worth millions. The contention is made that such inequality is unfair and undesirable and that the institution of inheritance ought to be either abolished entirely or, at the very least, radically amended.

"Furthermore, it is said, and it may be true, that the institution of inheritance is likely to contribute to a permanent and undesirable class differentiation, to the development of a fixed caste system. At an intermediate stage on the way to this result, those with large means derived from inheritance may use these means, in part, through propaganda and political corruption, so as to control government, influence
legislation and establish and maintain economic institutions favorable to their class interests and detrimental to the interests of the masses.

"There may, indeed, be danger in carrying the idea of inheritance to extremes. But, within proper limits, it is probably desirable that the institution be maintained. At any rate, its abolition seems to be inconsistent with the maintenance of the institution of the family and with the making of children dependent, in large degree, upon their parents. For the maintenance of the family in substantially its present form means that the future success and happiness of the children depend largely upon the home training they receive, upon the education their parents provide for them supplementing what the state provides for all, and upon the advice and help which, at various stages of their careers, their parents are able and willing to extend to them.

"Analogous to these other advantages is that of inheritance. As long as the family affections endure in their present strength, much of the happiness of parents will be realized only as they are permitted to work for the future prosperity of their children. General welfare and happiness would probably not be furthered by a policy which should entirely deprive parents of the privilege of bequest. Nor would the community
probably get, in the long run, the use of so much capital, for less would probably be accumulated. A parent will be less likely to save and to invest his earnings in the education of his children if he believes society will appropriate all the gain and will not allow his children to reap a larger income for the larger service which such education enables them to render. And, in like manner, a parent will be less inclined to save and to invest in the construction of material capital if he believes that society will allow his children to reap no advantage in return for the service from such capital.

"It is clearly illogical, then, to abolish the inheritance of wealth without abolishing at the same time all the advantages of nurture and education that the children of thoughtful, thrifty and affectionate parents have over the children of other parents. It is, in short, illogical to abolish completely the inheritance of wealth unless we also abolish the family and make all children wards of the state. And few of us would regard it as conducive to human welfare and happiness to do the latter.

"There is no intention to suggest, however, that inheritances should never be taxed or that the law of inheritance should never in any respect be changed. When, as at present, the state provides for inheritance of the property of intestate
decedents by remote collaterals who have often been unacquainted with their unconscious benefactors, it can hardly be said that the policy adopted has been dictated by the necessity of encouraging accumulation or by the desirability of giving men and women the happiness of safeguarding the future welfare of those for whom their affections are strongest. Also, so far as the existence of large estates is the outgrowth of a past when individuals have been allowed to receive large incomes which they have not earned, or so far as such estates may result from our inability ever completely to prevent the securing of ill-gotten gains, the regulation of the transmission of great estates or their high taxation may be the only means of avoiding the perpetuation of a most undesirable inequality. Even the transmission of estates honestly earned may possibly, although less likely, need to be limited or regulated or the inheritances heavily taxed, lest the inequality resulting from the bequeathal of these estates become unduly great and, perhaps, threaten democracy.

"We may fairly conclude, then, that the institution of inheritance should not be abolished, that, however, there may be justification for placing limits on the right of inheritance or for taxing inheritances and that, if a policy of taxation is adopted, there is a certain reasonableness
in making the rate of taxation progressive in proportion to the distance of relationship between the decedent and the beneficiary. And it may also be well to make the rate higher where the value of the property inherited is large than where it is small. For where this value is very large there is perhaps less reason to assume that the principal motive for its accumulation was to make provision for offspring and that the prospect of such a progressive tax would discourage the necessary saving. And there is less reason to worry lest the heirs fail to derive a sufficient advantage in the struggle for existence from the affection and thrift of the accumulators of the estate. And when the sums inherited are very large, the dangers, if any, from inheritance as conducing to great inequality, political corruption and permanent class differentiation, are more to be feared than when the sums inherited are but small.

"Perhaps sharply progressive inheritance taxation would help to cure the inequality which has resulted, in considerable degree, from our past errors in public policy. The permitting (for many years) of unfair competition, the long delay in developing proper supervision of our public service industries, our failure to stabilize the general price level, and the maintenance of a land and taxation policy which have consistently
allowed private persons to appropriate community-produced values,—all these mistakes and others have helped to bring about the inequality which carefully adjusted inheritance taxation (assuming that extensive evasion could and would be prevented) is expected to mitigate. But with our economic system reformed in all these respects, it is not so certain that continued inheritance taxation would be important either as a necessary means of preventing great inequality or as a source of any appreciable public revenue."

Whether circumstances would then justify the permanent retention of such a tax we need not, perhaps, inquire. But it should be noted here, whatever may be our final conclusion regarding the merits of different kinds of taxes, that inheritance taxation is subject to some criticisms which do not seem to apply to taxation of the rental value of land. Inheritance taxation, beyond certain limits, may discourage accumulation; land-value taxation can not. Inheritance taxation, if applied extensively to moderate amounts of property inherited by the very near of kin to decedents, is inconsistent with the maintenance of the family and of parental responsibility for offspring; land-value taxation

10See, in this connection, my book on The Economics of Taxation, New York (Holt), 1924, Chapter VIII, §8.
INCOMES, INEQUALITY AND TAXATION 67

is not. Inheritance taxation does not especially penalize speculation in land and does not make land cheap to those who would use it; land-value taxation does. Whatever its virtues, therefore, inheritance taxation can not be regarded as a substitute for taxation of the rental value of land.

§7

Inequality of Earned Incomes

Suppose, however, that it eventually becomes possible to do away with all unfair business practices, to stamp out the industry of the business highwayman, to break up, or to regulate, or operate by the public, all monopolies so that justice shall be done to the consumers of monopo-
lized goods, to make birth rates in different classes even enough and educational opportu-
nities general enough so as to avoid the partial monopoly which the relatively few now have of valuable training and skill, and to take by taxa-
tion for public purposes the rental income from land or sites. Would we then have the ideal economic society?

Although all incomes would then be earned, it might nevertheless be contended that the utility of a unit of money (e.g. a dollar) to the man who possesses many such units is so much less than its utility to the man who earns few, as to justify taxing the former more heavily and spending
some of the money really earned by the former, for the benefit of the latter. This is the theory on which charitable relief is largely based and it is also the basis of the so-called ability theory of taxation.

Clearly, however, there are dangers in carrying such a policy too far. Those whose ability is high in one line may, to be sure, often be persons of only mediocre ability in other lines of activity; but if the line in which they show ability is one in which ability is scarce relative to the use society has for it, such persons need to be encouraged to make full use of their ability and it is furthermore desirable that they should have descendants who inherit their capacity for such efficient service. (A system of taxing earned incomes which should come too close to leaving individual incomes equal would almost certainly discourage the revealing of ability above the average by those who have it or are capable of developing it, unless invidious distinctions of honor and rank in society were to take the place—if they could do so effectually—of differences in creature comforts.)

We need not say that the time can never come when the abler members of a group will put forth their full efforts for the welfare of their weaker social brothers and sisters, who, in turn, will gratefully accept equality of incomes bestowed
upon them by those whose productive efficiency is greater than theirs. But it is not to be assumed that this time has yet come, if it ever should or can. Furthermore, it is greatly to be desired that society should breed more largely from its abler than from its inferior members, that those who have high special abilities, provided these abilities are of a useful kind, should be well represented in posterity. This is true whether such exceptional ability is transmitted through the germ plasm or results from years of well-nurtured childhood, encouragement of intellectual interests and the influence of the ambitions and ideals of parents. It may indeed be true that there is now altogether too much of a tendency for society to breed from inferior strata rather than from the superior. But a change in moral standards and ideals, a growing pride in the ability to pass on worthwhile characteristics, and removal of the restrictions on dissemination of information relative to birth control, may some day change this. Absolute equality of incomes among adults, on the other hand, would make the evil worse, unless those of higher ability were willing to take for themselves and their children fewer and poorer creature comforts than their efforts gave to the inferior members of society. Again, incomes based on size of family would enable
those persons who irresponsibly have large families, together with their numerous children, to exploit almost without limit those who, by themselves having small families, endeavored to prevent population from outrunning the possibilities of comfortable subsistence. Whether or not, therefore, we might expect the efficient eventually to be willing to put forth their best efforts that the inefficient might fare equally well, it is not even to be desired that the efficient should be willing to put forth their best efforts that the inefficient might have as many or more children and as well cared for as those whose superior ability produced a greater volume of goods.

A parallel argument can be made regarding interest on the accumulation of capital. (It is perhaps not even desirable that those who save capital should have to see the interest earned by it go to the support and increase of the children of the incapable and unthrifty. And certainly one cannot but experience grave doubt whether capital would be saved in anything like the present degree if no income whatever were allowed from it either to the accumulator or to his children.)

It is to be hoped that no one will draw from the above remarks relative to the competition of individuals within any community and fitness
to survive, the conclusion that any selective purpose is served by allowing the private receipt of what we have called unearned incomes. Superior efficiency in producing worth-while goods is a very different thing, in its relation to societal interests, from superior craftiness in getting something for nothing. A society composed of persons of the former characteristic would have at hand the means for pleasurable existence on the part of all its members. A society composed of persons of the latter characteristic would be one in which each man's hand was "turned against his neighbor."

If all exploitive activities were terminated and if all unearned incomes derived from advantages of situation, etc., as distinct from unethical business practices, were appropriated by the public, the individual receipt of unearned incomes would be impossible. It would then be necessary to decide whether and how far the taxing of earned incomes for the sake of using the funds to benefit those whose earning power was small, could be regarded as a proper public policy. It is entirely possible that if the receipt of unearned incomes by individuals were henceforth completely prevented, the inequality remaining would not be such as to justify further attempts at leveling. For further attempts in this direction might be thought of as involving
the establishment of new privileged interests, through making it possible for those who produce least to enjoy equally or more nearly equally than their productive efficiency would seem to justify, with those who produce much.

However this and other problems ought to be settled, it is clear that an ideal economic order is not to be attained without thought and that it is unlikely to be attained in full all at once. If it be true that the exploited masses cannot rely upon the teaching of those journalists, political "leaders", professional economists and others, who constitute the intellectual defenders of things as they are, it is also true that without intelligent leadership in statecraft and an understanding, by their leaders, of economic principles, an understanding which the majority of socialist leaders certainly have not, blunders, discredit and eventual rejection will be the probable fate of those who might become effective forces of reform.

§8

Recapitulation

At the beginning of this chapter it was pointed out that before economic reform can be profitably discussed there must be an intelligent comprehension of the existing system of economic organization. For the beneficiaries of the present system
have their intellectuals who can give it theoretical justification and they know how, practically, to run it; while its violent overthrow by ignorant revolutionary groups would be almost certain to be attended with mistakes calamitous enough to discredit them and would quite possibly result in the restoration of the temporarily outlawed system of privilege.

Addressing ourselves to the securing of a birds-eye view of the existing economic system, we found it to be one of division of labor with voluntary specialization of individuals and their property in different lines of production. Prices are the inducements by which men are led to sell goods or to produce goods for sale. Compulsion might be substituted but probably would not be popularly approved. Competition tends towards partial equalization of returns in different lines but does not necessarily result in complete equalization. Thus, in any given relation of public demand for two different articles, there may be some persons and some sites as to whom and whose owners it is a matter of indifference whether they should be devoted to producing the one article or the other. But there may also be persons whose efficiencies are such that they secure much larger incomes where they are than they could get in an alternative line or, perhaps, than many persons in such an alternative line do
get; and a parallel statement can be made regarding the use of specific pieces of land and the interests of their owners.

Inequality results, then, so far as returns to labor are concerned, from differences of ability innate or acquired. So far as it results from differences of ability which are innate, it is undesirable that the multiplication of those of less ability should be encouraged at the expense of those of greater ability. So far as inequality of incomes is due to differences of opportunity, these differences are partly a matter of education and partly a matter of comparative birth rates. Low wages in any group are likely to be due to the numbers in that group, competing for employment, and these numbers depend as much on comparative birth rates as on the avenues of escape from the group through education.

In present-day economic society incomes are divided into wages for labor (including profits to self-employed labor), interest on capital and rent on land. Wages of labor are earned or unearned, as the terms are here used, according as they are received for an equivalent service rendered. If, for example, the owners and controllers of an industry derive a monopoly profit because their management has resulted in the building up of a monopoly which exploits the public, much of the so-called profit is unearned.
INCOMES, INEQUALITY AND TAXATION

So, also, both the controllers of a business and their hirelings, if engaged in corrupting legislators or in the practice of unfair competition, can not be said really to earn what they receive. The same distinction may be made as regards income from capital. Interest is unearned when the capital is used in antisocial and exploitive ways. It is earned when the use of the capital confers an equivalent benefit upon those from whom, in the last analysis, the interest is drawn. As to land, its rent, resulting from natural advantages or from advantages of situation relative to population centers (pure rent as distinguished from interest on improvements), is clearly unearned, and is no less unearned from the point of view of the remainder of society when the owner has paid some previous recipient the so-called value of the land for the privilege of enjoying the annual rent. And the rent of land is unearned whether the land is used in socially desirable ways or not, for, in any case, the owner is in no sense responsible for the existence, or the advantage for business, of his land.

Toward the end of the chapter we raised the question whether, supposing every kind of unearned income to be terminated or publicly appropriated, it would be desirable for the community to tax large earned incomes at a high rate for the purpose of preventing, in large part,
what inequality might otherwise still remain. For the view that this should be done could be cited a conceivable danger to democracy from inequality even of earned incomes, in case such earned incomes proved to be very unequal, and the theory of charitable relief according to which units of wealth give greatest utility to those whose wealth is small. But, on the other hand, it seemed that efficiency, survival of the best, and accumulation of capital might all be mili-tated against by too great an approach to equal-ity. Indeed, equality of incomes itself, if pro-ductive accomplishments are greatly uneven, is a form of privilege in favor of persons who con-tribute less than they receive. The institution of inheritance seemed to be desirable, but properly subject to limitations through taxation.

In any event, we are brought back to the con-clusion that the establishment of a radically improved economic order is not a simple task. And it cannot be successfully accomplished unless the great mass of the disinherited who would fain establish a better system than we now have are led by men of greater understanding of economic principles than is possessed by present-day Marxian theorists. Unfortunately, it seems to be these theorists who have attained chief influence among the supporters of radical economic re-forms. Scarcely ever do men prominent in public
life venture to take the lead in advocating any great reform which is not already widely popular.

"The path of democracy is in truth a way of peril, beset with the pitfalls of a too common ignorance and flanked by the ambushed forces of privilege. Yet only through this pathway can there be any hope at all of the eventual attainment of a better economic order. For although, in a democracy, interested persons and classes are ever seeking to confuse and mislead, in matters of economic policy, a citizenry unduly prone to believe itself championing worthwhile reform when it is really but subjecting itself to a more hopeless exploitation; nevertheless government by any limited class would be almost an absolute guarantee of the self-aggrandizement of that class at the expense of all others. With democracy there is at least the chance that education and the resulting growth of intelligence may lead to better things. We need not—if we are scientists we cannot—have the faith in democracy sometimes professed by the practical politician anxious to flatter the common man into giving him his support and vote, that 'the people' will always know and do what the general well-being requires. But we may have a limited faith in democracy as the only possible pathway—if any such pathway there be—to an economic system fundamentally wise and just."
