

work without molestation from the union seeking to dominate them and the coal mining industry.

Clearly then Mr. Welborn's position was not correctly stated in the pamphlet signed by himself, from which Mrs. Whitehead quoted. Although his language is different, Mr. Welborn's reconstructed statement explains his position to be exactly as Mrs. Whitehead described it:

You mean that you want every man free to take any job you offer him, on such terms as you see fit, without any dictation from a labor union.

The right of men to become slaves without molestation from the union seems to have been vindicated in southern Colorado. But as Mrs. Whitehead assured Mr. Welborn, he is within his rights in insisting on this travesty on freedom "so long as the men composing the labor unions vote to let you and a few others own the earth." If the loss of the strike impresses this fact on the labor unionists of Colorado, it will have done more for Labor's cause than a dozen strike victories could have accomplished.

### Good Advice from the Health Department.

The Department of Health of Chicago issues a monthly bulletin of advice concerning matters relating to public health. In the December issue it shows the relation of the Science of Political Economy to the Science of Health in the following: following:

If you have a vacant lot what are you doing with it? Has it occurred to you that there is some better use it may be put to than to let it lie idle and pay taxes on it? Of course, this is not the growing season, but next spring will be; and then what are you going to do? If your lot lies out on the west, northwest or southwest sides of the city, the soil is good and it will grow all kinds of vegetables. Why not, then, put the vacant lot to some good use? A great many thousands of bushels of potatoes alone could be produced on Chicago's vacant lots. Man is dependent on the soil for his living. Let us then make the land productive.

Calling attention to this fact is probably as far as the Health Department has power to go. But in doing this it makes clear the need of legislation to force holders of valuable unused land to either improve it or let go. Pending such legislation the possibility of vacant lot cultivation as a means of partial relief of the unemployed problem is indicated. Where this method has been tried with some success, the greatest difficulty has been in securing permission for use of land from landowners who presumably suspect the presence of a Singletax object lesson. The opposition of these landowners has in many places made such use of lots impossible. That

their suspicions are not without foundation may be readily admitted, but whether or not opposition is thus justified is another question. Perhaps if Chicago's United Charities would take up this sound suggestion of the Department of Health and use some of its vigorous campaign methods on the city's vacant landowners, Chicago might not be so deeply disgraced next winter as it is now by the presence of so much undeserved poverty and distress.

### Wasting the Earth.

The report of Vice Consul Thomas H. Bevan, of Tampico, Mexico, telling of the waste by fire and accident of large quantities of oil in that district, calls attention again to the enormous losses suffered by society through human carelessness. A well, said to be the largest in the world, and having a capacity of 150,000 barrels per day, is afire, and the company is making vain efforts to extinguish it. Another well with a capacity of 45,000 barrels per day, broke loose and poured 500,000 barrels of oil into the river before it was recapped. This is but a repetition of what has occurred in our own American oil fields, in the natural gas fields, and in the great timberlands of the north. Everywhere the eagerness to secure the largest profit in the smallest space of time, and with the least outlay, and the absence of all control and regulation by the public, led to many avoidable accidents that resulted in the destruction of vast quantities of the natural resources of the earth. Carelessness has allowed oilwells to catch fire and burn for long periods. Gas wells have been fired, without any means of shutting them off. And some have burned for years uninterruptedly. This is not as waterpower, that continuously replaces itself, but is fixed in quantity; and once gone it is gone forever. Men allowed natural gas to burn continuously, rather than pay for shutting it off, because it was cheaper. Cheaper perhaps it was to them, considered from the momentary advantage, but it cost society the loss of a large quantity of stored-up energy. The great timberlands were cut over in a way to invite fires, and to cause denudation; thus preventing the regrowth of the forest, and spoiling the lands and rivers besides. The conservationists, both nationally and internationally, have a great work before them.
